

Configure Device Groups

• Create Device Groups, on page 1

Create Device Groups

Creating device groups allows you to view and perform actions on a group of similar device types. A device can belong to only one device group.

Procedure

Step 1 In the main window, click **Traffic Analysis > Configure > Device Groups**.

Step 2 Click **Add Device Group**.

Step 3 Enter a name for the device group and a description (optional).

Step 4 Click **Save**.

Step 5 Click on the name of the device group you just created.

Step 6 To add devices to the device group, click **Link Devices**.

Step 7 Select the devices to add to the device group, then click **Link**.

A device can belong to one device group only. If any devices were previously added to a different device group, they are removed from the previous device group and added to the device group you selected.
