NAT64-6-DEFAULT_MAX_ENTRIES	6-Information	default max entries value [dec]	This is an information message which occurs when NAT is configured and a frame is dropped due to the default maximum entries limit. Starting with release 5 XNE NAT will use a default max-entries in the data plane based on the ESP type. This will not show in the configuration and is overriden by any user configuration of 'ip nat trans max-entries <value>'. The purpose of the default data plane limit is to protect the box from memory exhaustion which could occur if no limit is enforced.	cpp-ucode	-

Facility-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Recommended-Action
			The ACL specified in the message text associates the key chain specified\n\ in the message text with a set of RSVP neighbors. RSVP uses the specified\n\ key chain to authenticate each RSVP message exchanged with that set of\n\ RSVP neighbors after the association is configured. Subsequently the\n\ specified ACL has been reconfigured such that the key chain association\n\ is no longer valid for one or more RSVP neighbors in the set. This causes\n\ RSVP to search the configuration for another suitable key chain to use\n\ with those neighbors. If no such key chain is found RSVP will no longer\n\ be able to provide authentication for messages exchanged with those RSVP\n\ neighbors. This causes RSVP to discard RSVP messages from that set of\n\ neighbors. Because this may ultimately lead to loss of RSVP functionality\n\ with those neighbors RSVP generates this system message.		

Facility-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Recommended-Action
			This system\n\ message may also be generated if the ACL is subsequently changed so that\n\ it re-associates RSVP neighbors with the specified key chain. If RSVP is\n\ not using another key chain for the set of RSVP neighbors specified by\n\ the ACL RSVP will begin using the specified key chain to exchange\n\ authenticated RSVP messages with that set of RSVP neighbors potentially\n\ restoring RSVP functionality with those neighbors.

SPANTREE-3-BAD_PORT_NUM_SIZE	3-Error	Rejected an attempt to set the port number field size to [dec] bits valid range is [dec] to [dec] bits.	The spanning tree port identifier is a 16 bit wide field that is by default divided evenly between port priority and port number each sub field being 8 bits wide. This allows the port number field to represent port numbers between 1 and 255. However on systems with greater than 255 ports the size of port number portion of the port id must be increased to support the greater number of ports.
