Release Notes for Cisco ASR 9000 Series Routers, IOS XR Release 24.4.1

IOS XR 64-bit on Cisco ASR 9000 Series is the next generation operating system running in a virtualized environment with an underlying 64-bit Linux kernel. Cisco IOS XR operating system delivers greater agility, automation, and simplicity while reducing the cost of operating the networks.

In Release 24.4.1, BGP and IGP take approximately 10% longer to initiate the traffic flow compared to Release 24.3.1. This delay occurs after any event that triggers new bulk route learning and downloads, such as a router or line card reload, or any other event that can create such a condition.

For example, in the case of BGP IPv4 with a scale of 1 million routes, the route download could take an additional 10 to 15 seconds in Release 24.4.1 compared to Release 24.3.1.

The BGP and IGP traffic delay is only during the initial route programming phase. Once all routes have been learned, there are no functional impacts.

Delays in starting traffic flow cases occur only in situations involving router or line card reloads when using Fast Re-Route (FRR) and Equal-Cost Multi-Path (ECMP) as redundancy mechanisms for the data path.

Software Features Enhanced and Introduced

Feature	Description
Programmability	

Feature	Description
Data logging with gNSI AcctzStream service	This feature replaces the existing bi-directional data streaming service, **Acctz**, with the new server-streaming service, **AcctzStream** and ensures effective network optimization and resource utilization. With this feature, you can configure the maximum memory allocated for cached accounting history records using the **grpc aaa accounting history-memomy** command. The feature introduces these changes: **CLI:** • **grpc aaa accounting history-memory** For the specification on the gNSI Accounting (AcctzStream) RPCs and messages, see the Github repository.
gNOI Healthz	With gNOI Healthz, you can monitor and troubleshoot device health by collecting logs and conducting root-cause analysis (RCA) on detected issues. This proactive approach allows for the early identification and resolution of system health problems, thereby reducing downtime and enhancing reliability. For the specification on gNOI.healthz, see the GitHub repository.
Cloud Native BNG User Plane	
Enable SLAAC for PPPoE Subscriber Sessions	You can achieve seamless connectivity for Customer Premise Equipment (CPEs) using Stateless Address Auto-Configuration (SLAAC) with PPPoE for IPv6 address assignment. This method enables CPEs to automatically configure IPv6 addresses without relying on a DHCP server. By leveraging SLAAC, devices can self-assign addresses based on the IPv6 prefix from the router, simplifying address configuration and reducing administrative overhead. Previously, PPPoE only supported DHCPv6 for IPv6 address assignment. The feature introduces these changes: **CLI:** • **slaac** **YANG Data Models:** • `Cisco-IOS-XR-ptp-cfg.yang` (see GitHub, YANG Data Models Navigator)
Segment Routing	

Feature	Description
Delay and synthetic loss measurement for GRE tunnel interfaces	You can now measure the latency or delay experienced by data packets when they traverse a network, and also proactively monitor and address potential network issues before they impact users by measuring key parameters such as packet loss, and jitter for GRE tunnel interfaces. This feature enables you to report synthetic Two-Way Active Measurement Protocol (TWAMP) test packets that are deployed in delay-profile or delay measurement sessions, and enables delay measurement for GRE tunnel interfaces. The feature introduces these changes: **CLI:** The **performance-measurement interface** command supports the **tunnel-ip** keyword.
Fallback delay advertisement for interfaces	You can now advertise fallback delay value, retaining delay information in performance metrics even when delay metrics for interfaces are temporarily unavailable due to hardware, synchronization, or network connectivity issues. The feature ensures optimal routing decisions, by maintaining network stability and continuous performance, even when real-time metrics are temporarily inaccessible. Previously, the performance metrics did not include delay metrics when they were temporarily inaccessible, resulting in visibility gaps in the network and less effective routing. The feature introduces these changes: **CLI:** The **performance-measurement interface** command is modified with a new **advertise-delay fallback** keyword. **YANG Data Models:** • `Cisco-IOS-XR-um-performance-measurement-cfg.yang` See (GitHub, Yang Data Models Navigator)
Far-end delay metrics in one-way measurement mode	SR PM now enables network operators to compute both far-end (T4 – T3) and near-end (T2 – T1) delay metrics, providing a complete view of end-to-end delay across the entire data path. Measuring the far-end delay from the responder to the querier node improves visibility, and allows operators to accurately monitor and evaluate network performance. Previously, you could measure the near-end delay metrics for a given data path.

Feature	Description
Flexible algorithm with bandwidth optimization	The enhanced IGP flexible algorithm path computation optimizes paths by automatically adjusting to changes in link bandwidth, which is particularly advantageous for handling parallel L3 links and dynamic changes in link bandwidth, such as in L2 link bundles. This ensures optimal capacity paths by considering cumulative bandwidth in parallel links, preferring paths with the best available bandwidth and benefiting high-bandwidth traffic flows. In addition to traditional metrics like link delay or monetary cost, the algorithm also optimizes paths based on the maximum available bandwidth of links. The bandwidth metric can be locally configured or computed from advertised link bandwidth. The feature introduces these changes: **CLI:** • **bandwidth-metric flex-algo** • **metric-type bandwidth** • **reference-bandwidth** • **group-mode** **YANG Data Models:** • New Xpaths are introduced for `Cisco-IOS-XR-um-router-isis-cfg.yang` (see GitHub, YANG Data Models Navigator)
SR-TE policy with enhanced flexible algorithm metric types	We have enhanced the SR-TE policy at headend with flexible algorithm that supports additional metric types, user-defined and bandwidth, ensuring consistent path computation across flexible algorithm metric types and constraints, on both intra-IGP and inter-IGP domains. The feature also supports headend computed inter-domain SR policies with Flex Algo constraints and IGP redistribution or leaking. The feature introduces these changes: **CLI:** • The **flex-algo-metric-type** keyword is introduced in the **effective-metric admin-distance** command. **YANG Data Models:** • New Xpaths are introduced for `Cisco-IOS-XR-infra-statsd-oper.yang` (see GitHub, YANG Data Models Navigator)
Segment routing Tree-SID interoperability and SR-P2MP enhancements	The feature introduces enhancements to the SR Tree-SID functionality and SR-P2MP Policy, enabling full alignment with the Path Computation Element Protocol (PCEP) standard as per IETF specifications. These improvements enable interoperability between Path Computation Client (PCC) devices from different vendors connected to the PCE, while still supporting the previous Cisco-proprietary implementation. The feature introduces these changes: **CLI:** • The **show pce ipv4** and **show segment-routing traffic-eng pcc ipv4** commands are enhanced to display the SR-P2MP capability and the number of SR-P2MP instances.

Feature	Description
VRF-to-VRF route leaking in SRv6 core	VRF-to-VRF route leaking enables sharing of routes between VRFs while maintaining their isolation. This feature allows the source VRF to send leaked routes to remote PEs or Route Reflectors (RRs) across an SRv6 core network, similar to an MPLS core network, enabling communication between different service tenants or administrative domains without compromising VRF isolation.
Broadband Network Gateway	
BNG with EVPN Port-Active Multihoming to Manage Service Redundancy Group	You can now ensure faster detection of device failures, more accurate response, and a quicker redundancy mechanism using BNG with EVPN Port-Active multihoming. EVPN Port-Active multihoming with BNG allows EVPN to manage port status and control the Service Redundancy Group (SRG) roles, eliminating the need for additional protocols and providing uninterrupted connectivity for subscriber sessions, resulting in simplified access network management and improved overall reliability.
Duplicate Framed-Route for PTA Subscribers	You can enhance the efficiency of your network by enabling PTA subscribers to use identical Framed-Routes with different metric values for subscriber WAN redundancy and load balancing Earlier only one Framed-Route per subscriber was supported. The feature introduces these changes: **CLI:** • **ppp duplicate-framed-route** **YANG Data Models:** • Cisco-IOS-XR-ppp-ma-global-cfg (see GitHub, YANG Data Models Navigator)
Performance Tuning for ipoe-dhcp-client-reboot Feature	You can minimize subscriber network churn during network faults, such as Optical Network Terminal (ONT) reboots and network flaps by managing the **ipoe-dhcp-client-reboot** functionality. We have enabled two timers by default to monitor network flaps and disable the **ipoe-dhcp-client-reboot** functionality during network flaps. Disabling the functionality temporarily prevents unnecessary session terminations and reduces network churn. The feature introduces these changes: **CLI:** • **ont-reboot sir-flap-duration** • **ont-reboot ont-disable-duration** • The **backpressure-level** keyword is modified in the **subscriber database** command.
L2VPN and Ethernet Services	

Feature	Description
EVPN MAC Scale Limit and Fast Age Out	Introduced in this release on: Modular Systems (ASR 9010, ASR 9912, ASR 9922, ASR 9903)(select variants only*); *This feature is supported on: • A9K-4HG-FLEX-TR • A9K-4HG-FLEX-SE • A99-4HG-FLEX-TR • A99-4HG-FLEX-SE • A9K-8HG-FLEX-TR • A9K-8HG-FLEX-SE • A9K-20HG-FLEX-TR • A9K-20HG-FLEX-SE • A99-24HG-FLEX-SE • A99-24HG-FLEX-TR • A99-32X100GE-X-SE • A99-32X100GE-X-TR • A99-10X400GE-X-TR • A99-10X400GE-X-SE • A9K-RSP5-SE • A9K-RSP5-X-SE • A99-RP3-SE • A99-RP3-X-SE To reduce the maximum aging time for EVPN learned MAC addresses from 2 hours to 30 minutes, you must reduce the MAC scale to 500k using the **hw-module profile scale l2-mac-500k** command. The feature introduces these changes: **CLI**: • The **l2-mac-500k** keyword is introduced in the **hw-module profile scale** command. **YANG Data Model**: • `Cisco-IOS-XR-um-asr9k-hw-module-prm-cfg.yang` (see GitHub, YANG Data Models Navigator)
General Administration	

Feature	Description
Dynamic iTCAM partitioning for a higher BVI scale for A99-12X100GE and A9K-4X100GE line cards	This feature enables you to recarve the internal TCAM partition for BVI in the L2 table for A99-12X100GE and A9K-4X100GE line cards thus facilitating a higher BVI scale. This feature allows to set the two new profiles, **to-profile-se2** and **to-profile-se3** so that the scale of the partition where BVI exists in the internal TCAM increases to 2.5K entries with **to-profile-se2** and 3K entries with **to-profile-se3** in the L2 table for A99-12X100GE and A9K-4X100GE line cards. The feature introduces these changes: **CLI:** The **to-profile-se2** and **to-profile-se3** keywords are introduced in the **hw-module profile itcam** command. **YANG Data Model:** New XPaths for `Cisco-IOS-XR-um-asr9k-hw-module-prm-cfg.yang` (see GitHub, YANG Data Models Navigator)
System Security	
RADIUS with TLS protection	Remote Authentication Dial-In User Service (RADIUS) over Transport Layer Security (TLS) or RADSEC is now supported on Cisco ASR 9000 routers. You can configure the RADIUS protocol on the Cisco router (RADIUS client) to redirect RADIUS packets to a remote RADIUS server connected over TLS for Authentication, Authorization, and Accounting (AAA) services. Without TLS, RADIUS packets may be subject to potential security vulnerabilities, including data exposure, replay attacks, weak authentication, and encryption vulnerabilities, especially when transmitted across untrusted networks. The feature introduces these changes: **CLI:** • The keyword **radsec-server** is introduced in the **radius-server host** command. **YANG Data Models:** • New Xpath for `Cisco-IOS-XR-um-aaa-cfg.yang` • New Xpath for `Cisco-IOS-XR-aaa-lib-cfg.yang` (see GitHub, YANG Data Models Navigator)
System Monitoring	
Syslog Message Sent to Syslog Servers using Rsyslog Daemon	To handle a high rate of system logging, you can use the rsyslog daemon to forward syslog messages to remote syslog servers.

YANG Data Models Introduced and Enhanced

This release introduces or enhances the following data models. For detailed information about the supported and unsupported sensor paths of all the data models, see the Github repository. To get a comprehensive list of the data models supported in a release, navigate to the Available-Content.md file for the release in the Github repository. The unsupported sensor paths are documented as deviations.

For example, openconfig-acl.yang provides details about the supported sensor paths, whereas cisco-xr-openconfig-acl-deviations.yang provides the unsupported sensor paths for openconfig-acl.yang on Cisco IOS XR routers.

You can also view the data model definitions using the YANG Data Models Navigator tool. This GUI-based and easy-to-use tool helps you explore the nuances of the data model and view the dependencies between various containers in the model. You can view the list of models supported across Cisco IOS XR releases and platforms, locate a specific model, view the containers and their respective lists, leaves, and leaf lists presentedvisually in a tree structure.

Feature	Description
Programmability	
openconfig-aft-summary.yang	The OpenConfig data model is revised from version 2.4.0 to 4.3.0. The new aft-summaries container provides the count of routes per origin protocol for both IPv4 and IPv6 protocols. The feature introduces the following change: **CLI:** • The detail keyword is introduced in the **show cef tables**command. You can stream Model-driven telemetry (MDT) and Event-driven telemetry (EDT) data for this OpenConfig data model.
Openconfig-platform-transceiver Version 0.13.0	The OpenConfig data model provides various metrics and thresholds for transceiver monitoring on gNMI subscribe. It includes minimum, maximum, average, instant, interval, minimum-time, and maximum-time values for containers such as supply-voltage, laser-temperature, tec-current, and target-frequency-deviation. The model also defines upper thresholds for transceiver with leaves like laser-temperature-upper, output-power-upper, input-power-upper, laser-bias-current-upper, supply-voltage-upper, and module-temperature-upper, as well as lower thresholds leaves such as laser-temperature-lower, output-power-lower, input-power-lower, laser-bias-current-lower, supply-voltage-lower, and module-temperature-lower. Additionally, it supports transceiver leaves such as state, enabled and module-functional-type, and transceiver physical-channels leaves including associated-optical-channel, tx-laser, target-output-power, and laser-age. This OC model supports event-driven and model-driven telemetry.

Feature	Description
Openconfig-terminal-device.yang Version 1.9.0	The OpenConfig data model provides instant, minimum, maximum, and average values for parameters of a terminal device using the pre-fec-ber, post-fec-ber, carrier-frequency-offset, modulator-bias-x-phase, modulator-bias-y-phase, modulator-bias-yi, modulator-bias-yq, osnr, q-value, and sop-roc containers. These parameters include Bit Error Rate (BER), channel quality value in decibels, and electrical signal-to-noise ratio in Baud Rate. Additionally, the model offers information on signal distortion, target output power, operational mode of a channel, the frequency of the optical channel, and the input optical power of the port using leaves chromatic-dispersion and target-output-power.
Cisco-IOS-XR-um-performance-measurement-cfg	This unified data model is enhanced with a new container fallback to advertise a fallback delay value, retaining delay information in performance metrics even when the delay metrics for interfaces is temporarily unavailable due to hardware, synchronization, or network connectivity issues.
Cisco-IOS-XR-um-asr9k-hw-module-prm-cfg.yang	This unified data model for PRM is enhanced with new enumerations under the existing leaf, **internal-itcam**, which allows to switch between TCAM profiles to carve a higher BVI scale for the A99-12X100GE and A9K-4X100GE line cards.
Cisco-IOS-XR-um-router-isis-cfg.yang	The latest update to the Cisco-IOS-XR-um-router-isis-cfg.yang unified data model includes the following additions: • The **metric-type**leaf is enhanced to include **bandwidth** and **generic** as metric types. • The **auto-cost** container - This is a new container in the **flex-algo** container to configure the auto-cost for bandwidth metric. The newly added **reference-bandwidth-number, granularity,** and **group-mode** leaves enable you to configure the different parameters required for bandwidth metric auto-cost calculation.
Cisco-IOS-XR-um-router-isis-cfg	This Cisco unified YANG data model is enhanced to introduce a new container, **protocol shutdown**, which allows you to gracefully shut down IS-IS on an interface or router without abruptly interrupting network operations.

Caveats

Table 1: Cisco ASR 9000 Series Router Specific Bugs

Bug ID	Headline
CSCwn01183	Post router reload ,interface creation failed for 4x10G breakout on A9K-16X100GE-TR LC

Behavior Changes

- You can monitor traffic statistics in bytes for an Access Control Entry (ACE) in an Access Control List (ACL) in the ingress direction. The traffic statistics per ACE includes the total bytes of traffic permitted or denied through an ACE in an ACL across all router interfaces where the ACL is applied. You can use the **show access-lists ipv4** command or `Cisco-IOS-XR-ipv4-acl-opercisco` native yang model to view traffic statistics per ACE in bytes for IPv4 ACLs, and the **show access-lists ipv6** command or `Cisco-IOS-XR-ipv6-acl-oper` native yang model to view traffic statistics per ACE in bytes for IPv6 ACLs.
- The BGP rlimit, which defines the maximum size to which the heap memory of the bgp process can grow, has been increased based on available RAM on the Route Processor or Route Switch Processor. Here are the specific settings:
  - If the available RAM is 48Gb, the BGP max rlimit is set to 16Gb.
  - If the available RAM is 40Gb, the BGP max rlimit is set to 12Gb.
  - If the RAM is less than 32Gb, the BGP max rlimit is set to 8Gb.

Compatibility Matrix for EPNM and Crosswork with Cisco IOS XR Software

The compatibility matrix lists the version of EPNM and Crosswork that are supported with Cisco IOS XR Release in this release.

Table 5: Compatibility Matrix

Cisco IOS XR	Crosswork	EPNM
Release 24.4.1	Crosswork Optimization Engine 6.0	Evolved Programmable Network Manager 7.1.1

Important Notes

- Repetitive Smart Licensing evaluation expired warning messages are displayed on the console every hour, but no functionality impact is observed on the device. To stop these repetitive messages, you should register the device again with a new registration token.
- From IOS XR Release 7.0, 1st and 2nd generation of Ethernet ASR 9000 line cards are not supported.
- Country-specific laws, regulations, and licenses—In certain countries, use of these products may be prohibited and subject to laws, regulations, or licenses, including requirements applicable to the use of the products under telecommunications and other laws and regulations; customers must comply with all such applicable laws in the countries in which they intend to use the products.
- Exceeding Cisco testing—If you intend to test beyond the combined maximum configuration tested and published by Cisco, contact your Cisco Account Team or Technical Support representative to discuss how to engineer a large-scale configuration for your purpose.
- Starting Cisco IOS XR Software Release 24.1.1, ISSU upgrades and ISSU SMU are not supported for ASR 9000 third-generation line cards.
- For ZTP, In Cisco IOS XR Release 7.3.1 and earlier, the system accepts the device sending **user-class = "exr-config"**; however starting Cisco IOS XR Release 7.3.2 and later, you must use only **user-class = "xr-config"**.

  In Cisco IOS XR Release 7.3.2 and later, use:

```
host cisco-rp0 {
   hardware ethernet e4:c7:22:be:10:ba;
   fixed-address 172.30.12.54;
   if exists user-class and option user-class = "iPXE" {
      filename = "http://172.30.0.22/boot.ipxe";
   } elsif exists user-class and option user-class = "xr-config" {
      filename = "http://172.30.0.22/scripts/cisco-rp0_ztp.sh";
   }
}
```

- The auto FPD upgrade may result in certain intentional exceptions, which may need manual upgrades or reloading for a few FPDs. We recommend you use the **show hw-module fpd** command to check the hardware module status immediately after the FPD auto upgrade is complete and take necessary action in both admin and XR VM mode. That is, if any FPD displays a **NEED UPGD** status, then upgrade those FPDs individually by the manual upgrade and follow it with a reload in admin mode, and if any FPDs show a **RLOAD REQ** status, perform a hardware module reload from admin mode.

Licensing

Starting with Cisco IOS XR Release 24.1.1, Smart Licensing Using Policy (SLP) is the default Licensing model. When you upgrade to the Cisco IOS XR Release 24.1.1 release or later, the Smart Licensing Using Policy is enabled by default.

You can migrate your devices to Smart Licensing with Policy model, see *Migrating from Smart Licensing to Smart Licensing Using Policy*, Smart Licensing Using Policy on Cisco IOS XR Routers.

We recommend that you update to the latest version of SSM On-Prem or Cisco Smart Licensing Utility.

Note SSM On-Prem and CSSM both support SLP devices and SL devices. SLP devices and SL devices can coexist in a network. The Smart Licensing (SL) model is available in releases Cisco IOS XR Release 7.11.1 and earlier.

Supported Transceiver Modules

To determine the transceivers that Cisco hardware device supports, refer to the Transceiver Module Group (TMG) Compatibility Matrix tool.

Supported Modular Port Adapters

For the compatibility details of Modular Port Adapters (MPAs) on the line cards, see the datasheet of that specific line card.

Production Software Maintenance Updates (SMUs)

A production SMU is a SMU that is formally requested, developed, tested, and released. Production SMUs are intended for use in a live network environment and are formally supported by the Cisco TAC and the relevant development teams. Software bugs identified through software recommendations or Bug Search Tools are not a basis for production SMU requests.

For information on production SMU types, refer the Production SMU Types section of the *IOS XR Software Maintenance Updates (SMUs)* guide.

Upgrading Cisco IOS XR Software

Cisco IOS XR Software is installed and activated from modular packages, allowing specific features or software patches to be installed, upgraded, or downgraded without affecting unrelated processes. Software packages can be upgraded or downgraded on all supported card types, or on a single card (node).

Software packages are installed from Route Processor Module (RPM) files that contain one or more software components.

The upgrade document is available along with the software images.

Note If you have mLACP/ICCP Redundancy Model setup, ensure that you upgrade the active and standby nodes to the same IOS XR version while upgrading to a newer version of the ASR 9000 router.

Cisco IOS XR Error messages

To view, search, compare, and download Cisco IOS XR Error Messages, refer to the Cisco IOS XR Error messages tool.

Cisco IOS XR MIBs

To determine the MIBs supported by platform and release, refer to the Cisco IOS XR MIBs tool.
