

Manage Tenants and Users

- Manage a Security Cloud Control Tenant, on page 1
- Manage Users in Security Cloud Control, on page 23
- Active Directory Groups in User Management, on page 23
- Create a New Security Cloud Control User, on page 29
- **Understand** user roles in Security Cloud Control Firewall Management, on page 35
- Add a User Account to Security Cloud Control, on page 39
- Edit a User Record for a User Role, on page 40
- Delete a User Record for a User Role, on page 41

Manage a Security Cloud Control Tenant

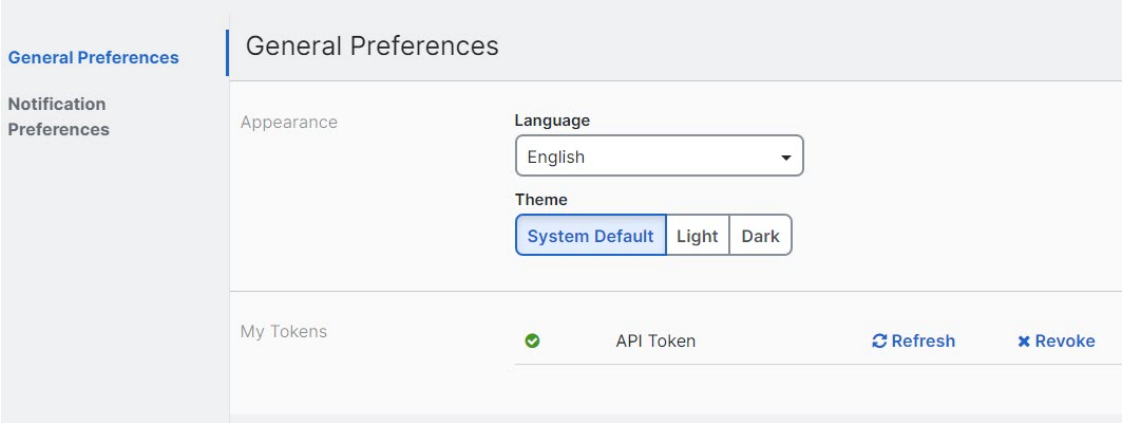

Security Cloud Control gives you the ability to customize certain aspects of your tenant, users, and notification preferences. Review the following settings available for customized configuration:

Configure User Preferences

See the following topics regarding general Security Cloud Control Settings:

General Preferences

Select the desired language and theme for the Security Cloud Control UI to display in. This selection only affects the user who makes this change.

Change the Security Cloud Control Web Interface Appearance

You can change the way the web interface appears.

Procedure

Step 1 From the drop-down list under your username, choose **Preferences**.

Step 2 In the **General Preferences** area, select a **Theme**:

- **Light**
- **Dark**

Manage user notification preferences

Security Cloud Control Firewall Management generates notifications whenever a device linked to your tenant encounters a specific event. This includes actions taken by the device, expiring or expired device certificates, or the start, completion, or failure of a report generation task. By default, these notifications are enabled and visible to all users associated with the tenant, regardless of their role. You have the option to customize your personal notification preferences to display only the alerts that interest you. These preferences are unique to you and do not impact other users connected to the tenant.

Note Changes made to the notifications listed below are automatically updated in real time and do not require deployment.

View your personal preferences in the **Username ID** > **Preferences** > **Notification Preferences** page. Your Username ID is always located in the upper right corner of Security Cloud Control across all pages. From this page you can configure the following "**Notify Me in Security Cloud Control When**" alerts.

Device workflow alerts

- **Deployments** - This action does not include integration instances for SSH or IOS devices.

- **Backups** - This action is only applicable for FDM-managed devices.
- **Upgrades** - This action is only applicable for ASA and FDM-managed devices.
- **Migrate Firewall Threat Defense to cloud** - This action is applicable when changing the Firewall Threat Defense

  device manager from Firewall Management Center to Security Cloud Control.

Device event alerts

- **Went offline** - Applies to all devices associated with your tenant.
- **Back online** - Applies to all the devices associated with your tenant.
- **Conflict detected** - Applies to all the devices associated with your tenant.
- **HA state changed** - Indicates the device within an HA or failover pair, the current state, and the state it changed from. This action applies to all HA and failover configurations associated with your tenant.
- **Site-to-Site session disconnected** - Applies to all site-to-site VPN configurations configured in your tenant.

Event search report alerts

- **Report generation started**: Notifies you when a report generation task starts. This applies to both immediate and scheduled search reports.
- **Report generation completed**: Notifies you when a report generation task ends. This applies to both immediate and scheduled search reports.
- **Report generation failed**: Notifies you when a report generation task fails. This applies to both immediate and scheduled search reports. Check the parameters or query and try again.

Application insights alerts

- **Application available**: Notifies you when a monitored application becomes available.
- **Application unavailable**: Notifies you when a monitored application becomes unavailable.

Opt out of notifications

By default, all notification types are enabled. To stop receiving a notification type, clear that notification and click **Save**.

Manage email notifications

Enable the `Email notifications` toggle button to receive email for the alerts that you select.

By default, **Use Security Cloud Control notification settings above** is selected. When this option is selected, email notifications match the same notifications and events that you selected in the **Notify Me in Security Cloud Control When** sections.

If you want email notifications for only some alerts, clear **Use Security Cloud Control notification settings above**, select the alert types that you want to receive by email, and then click **Save**.

View Security Cloud Control notifications

Click the notifications icon  to view the most recent alerts that have occurred or affected the devices that you onboarded to your tenant. The settings that you choose on the Notification Settings page determine the notification types that appear in Security Cloud Control Firewall Management.

This drop-down page is grouped into three tabs: Overview, All, and Dismissed.

Overview tab

The **Overview** tab displays a combination of the most recent high-priority alerts and events to which you are subscribed. High priority events are the following:

- Deployment Failed
- Backup Failed
- Upgrade Failed
- Migrate FTD to Cloud-Delivered Firewall Management Center Failed
- Device went offline
- Device HA state changed
- Device certificates expiring

You can configure which alerts you want to receive by clicking the Notification Settings in the Notifications window or by selecting **UserID** > **User Preferences** page. The User ID button in the upper right corner of the dashboard.

All tab

Displays all notifications, regardless of priority, including email subscription notifications and all high-priority items.

Dismissed tab

Displays notifications that you dismissed. You can dismiss individual notifications by clicking the "**x**" of the notification.

Opting to **Dismiss** notifications from the drop-down menu dismisses notifications from **both** the "Overview" and "All" tabs. They will remain in the **Dismiss** tab for 30 days, after which they will be removed from Security Cloud Control.

Search notifications

When viewing the notifications drop-down window, for any of the tabs mentioned above, you can use the search bar at the top of the drop-down to query for key words or alerts.

Configure general settings

Use **Administration** > **General Settings** to manage organization-wide settings that affect multiple managed devices and users in your managed organization.

Note You do not see toggle buttons for features that are not enabled for your managed organization.

Enable the option to auto-accept device changes

When this setting is enabled, Security Cloud Control Firewall Management automatically accepts changes that users make directly on the device. If you leave this setting disabled, or disable it later, you must review each device conflict before you accept it.

Follow these steps to enable automatic acceptance of device changes:

Procedure

Step 1 Choose **Settings** > **General Settings**.

Step 2 Choose **Administration** > **General Settings**.

Step 3 Turn on the **Enable the option to auto-accept device changes** toggle button.

Enable object sharing with Multicloud Defense

Enable this setting to share Multicloud Defense network objects from Security Cloud Control Firewall Management.

Follow these steps to enable object sharing with Multicloud Defense:

Procedure

Step 1 Choose **Settings** > **General SettingsAdministration** > **General Settings**.

Step 2 Turn on the **Enable object sharing with Multicloud Defense** toggle button.

Set the default conflict detection interval

This interval determines the frequency at which Security Cloud Control polls onboarded devices for changes. The selection applies to all devices managed in this tenant. You can change this option at any time.

Note This selection can be overridden via the **Conflict Detection** option available from the **Security Devices** page after you have selected one or multiple devices.

Follow these steps to set the default conflict detection interval:

Procedure

Step 1 Choose **Settings** > **General Settings**.

Step 2 Choose **Administration** > **General Settings**.

Step 3 From the **Default conflict detection interval** drop-down list, select a time value.

Enable scheduled automatic deployments

Enabling the option to schedule automatic deployments allows you to schedule future deployments at a date and time when it is convenient. Once you enable this option, you can schedule a single automatic deployment or set up recurring automatic deployments.

Changes you make on Security Cloud Control for a device are not automatically deployed to the device if it has pending changes . If a device is not in the **Synced** state, such as **Conflict Detected** or **Not Synced**, scheduled deployments are not executed. The jobs page lists any instance where a scheduled deployment fails.

If you turn off **Enable the Option to Schedule Automatic Deployments**, all scheduled deployments are deleted.

Important If you use Security Cloud Control to create more than one scheduled deployment for a device, the new deployment overwrites the existing deployment. If you create more than one scheduled deployment for a device using the API, you **must** delete the existing deployment before scheduling the new deployment.

Follow these steps to enable scheduled automatic deployments:

Procedure

Step 1 Choose **Settings** > **General Settings**.

Step 2 Choose **Administration** > **General Settings**.

Step 3 Turn on the **Enable the option to schedule automatic deployments** toggle button to enable it.

Manage web analytics

Web analytics provides anonymous product usage information to Cisco based on page hits. The information includes pages viewed, the time spent on a page, browser versions, product version, and device hostname. This data helps Cisco determine feature usage patterns and improve the product. All usage data is anonymous and no sensitive data is transmitted.

Web analytics is enabled by default. To disable web analytics or re-enable it in the future, complete these steps:

Procedure

Step 1 Choose **Settings** > **General Settings**.

Step 2 Choose **Administration** > **General Settings**.

Step 3 Turn on the **Web Analytics** toggle button to enable it.

Enable event data sharing with Talos

Share malicious event data from your device with Talos, Cisco's threat intelligence organization. Sharing event data allows Talos to improve threat detection and response capabilities, provide more targeted security updates for your network, and deliver better protection against emerging threats.

For more information about Talos, see the Cisco Talos product page.

Note The **Enable event data sharing with Talos** setting in Security Cloud Control and the **Talos Threat Hunting Telemetry** option in Cloud-Delivered Firewall Management Center are separate settings. The setting in Security Cloud Control shares malicious event data from your devices with Talos.

To add threat-hunting rules to the global intrusion policy and send events from those rules to Talos, enable **Talos Threat Hunting Telemetry** in Cloud-Delivered Firewall Management Center at **Administration > Configuration > Intrusion Policy Preferences**.

Enabling the **Enable event data sharing with Talos** toggle button does not automatically activate the **Talos Threat Hunting Telemetry** feature in Cloud-Delivered Firewall Management Center. For the best results with this feature, also enable the **Talos Threat Hunting Telemetry** in Cloud-Delivered Firewall Management Center. For more information, see Set Intrusion Policy Preferences.

Sharing event data with Talos is enabled by default. To opt out, follow this procedure:

Procedure

Step 1 Choose **Settings** > **General Settings**.

Step 2 Choose **Administration** > **General Settings**.

Step 3 Turn off the **Enable event data sharing with Talos** toggle button to disable this setting.

Note
Sharing event data enables Talos to provide relevant security insights for your network. Disabling this setting might limit your ability to fully leverage Talos's capabilities and could affect your network's defense against evolving threats.

Set the FDM Default recurring backup schedule

Use this setting to configure a default recurring backup schedule for your devices. When you schedule a backup for a device, you can use the default values or customize them. If you change the default recurring backup schedule, existing scheduled backups keep their current recurring settings.

Follow these steps to set the FDM default recurring backup schedule:

Procedure

Step 1 Choose **Settings** > **General Settings**.

Step 2 Choose **Administration** > **General Settings**.

Step 3 Under the **FDM Default Recurring Backup Schedule** section, from the **Frequency** drop-down, select daily, weekly, or monthly backup.

Step 4 Select the time of day for the backup. Enter the time using the 24-hour format in Coordinated Universal Time (UTC); for example, 22:00 (10:00 PM UTC).

Step 5 For weekly backups, select the days of the week for the backup. For monthly backups, select the **Days of Month** field and add the days when the backup should run. If you enter day 31 for a month with fewer than 31 days, the backup will not run for that month. Enter a name and description for the backup schedule.

Step 6 Click **Save**.

View firewall management instance details

Firewall Management Instance Details are helpful if you need to contact the Cisco Technical Assistance Center (TAC). You can copy these tenant details by clicking the copy icon.

- **Firewall Management Instance Name**: The display name of the firewall management instance.
- **Firewall Management Instance ID**: The system-generated unique identifier for the firewall management instance in Cisco Security Cloud Control.
- **Secure Services Exchange ID**: The unique identifier for the firewall management instance in the Secure Services Exchange environment. Cisco uses this value for service integration and backend correlation across cloud services.
- **Security Cloud Control Organization ID**: The unique identifier of the Security Cloud Control organization associated with the firewall management instance.

Tenant Name

Your tenant name also identifies your tenant. Note that the tenant name is not the organization name. This information will be helpful if you need to contact the Cisco Technical Assistance Center (TAC).

Use the Security Cloud Control Firewall Management platform navigator

The platform navigator is a nine-block applications cross-launcher ( ) that appears on the top-right corner of Security Cloud Control. You can readily cross-launch to these Cisco networking and security applications:

Networking applications

- **Catalyst**: Cisco Catalyst products include a wide variety of network switches, wireless controllers, wireless access points, and edge platforms and routers, supporting enterprise-class business needs to heavy-duty and rugged networking environments.
- **Intersight**: Cisco Intersight is a cloud operations platform that consists of optional, modular capabilities of advanced infrastructure, workload optimization, and Kubernetes services. Cisco Intersight infrastructure services include the deployment, monitoring, management, and support of your physical and virtual infrastructure. It supports Cisco Unified Computing System (Cisco UCS), Cisco HyperFlex hyperconverged infrastructure (HCI), and other third-party Intersight-connected targets.
- **IoT Operations Dashboard**: Cisco IoT Operations Dashboard is a cloud-based IoT services platform that empowers operations teams to securely connect, maintain, and gain insights from industrial networking devices and connected industrial assets at massive scale. With one comprehensive view of all their connected industrial assets, operations teams can uncover valuable insights that help them streamline operations and drive business continuity.
- **Meraki**: Cisco Meraki is an IT and IoT cloud-managed platform that provides a centralized management platform for Cisco Meraki devices.
- **Spaces**: Cisco Spaces is a cloud-based location services platform through which organizations can gain insights into how people and things move throughout their physical spaces. With these insights, they can deliver contextual engagements that are valuable and relevant. Besides looking at where people go, organizations can also drive operational efficiencies by monitoring the location, movement, and utilization of assets.
- **ThousandEyes**: Cisco ThousandEyes is a cloud service suite that helps monitor and measure the availability and performance of web applications, services, and networks. It provides end-to-end visibility from any user to any application over any network, enabling enterprises to swiftly get to the source of issues, resolve them faster, and manage performance effectively.
- **Workflows**: Cisco Workflows is a cloud-hosted automation application that is part of the larger Cisco Networking Cloud vision. It provides an entitlement to cross-domain automation capabilities for Cisco customers. It streamlines repetitive and error-prone tasks across both Cisco and third-party applications using custom and premade automation templates, as well as various adapter options that can be provided by Cisco or built independently, reaching targets in the cloud or on-premises.

Security applications

- **Duo Security**: Cisco Duo is a user-centric zero-trust security platform with two-factor authentication to protect access to sensitive data for all users, devices, and applications. It offers features such as adaptive policies, single sign-on (SSO), and advanced endpoint visibility, making it a comprehensive solution for securing remote access and maintaining business continuity.
- **Secure Access**: Cisco Secure Access simplifies IT operations through a single, cloud-managed console, unified client, centralized policy creation, and aggregated reporting. Extensive security capabilities converged in one solution (ZTNA, SWG, CASB, FWaaS, DNS security, RBI, and more) mitigate security risk by applying zero trust principles and enforcing granular security policies. Market leading Talos threat intelligence fuels unmatched threat blocking to mitigate risk and speed investigations.
- **Secure Endpoint**: Cisco Secure Endpoint, formerly known as Cisco AMP for Endpoints, is a cloud-managed endpoint security solution designed to prevent breaches and rapidly detect, contain, and remediate threats. It instantly checks your files against a cloud-based scanner with advanced tracking

features. These features enable security analysts to identify and isolate initial outbreak sources. The solution also provides retrospective quarantine for files found to be malicious.

- **Cisco Security Provisioning and Administration**: Cisco Security Provisioning and Administration is a web application that provides centralized management of Cisco Secure product instances, user identity, and user access management across Cisco Security Cloud. Security Cloud Control administrators can create new Security Cloud enterprises, manage users in an enterprise, claim domains, and integrate their organization's SSO identity provider, among other tasks.
- **XDR**: Cisco Extended Detection and Response (XDR) is a cloud-based solution designed to simplify security operations and empower security teams to detect, prioritize, and respond to sophisticated threats. By integrating both Cisco and third-party security solutions into a unified platform, Cisco XDR offers a comprehensive approach to threat management. Integrated with the threat intelligence provided by Talos, Cisco XDR enriches incident data with additional context and asset insights, reducing false positives and enhancing overall threat detection, response, and forensic capabilities.

Tenant Notification Settings

On the Security Cloud Control toolbar, click the notification button .

All users associated with your tenant will automatically see these alerts. In addition, some or all of these alerts can be emailed to you.

Note You must have an **Super Administrator** user role to change these settings. See User Roles for more information.

Email Subscribers

Add or modify the emails that receive alerts from your Security Cloud Control tenant. See Enable Email Subscribers, on page 10 for more information.

Service Integrations

Enable Incoming Webhooks on your messaging app and receive Security Cloud Control notifications directly to your app dashboard. See Enable Service Integrations for Security Cloud Control Notifications for more information.

Enable Email Subscribers

An email notification from Security Cloud Control denotes the type of action and the affected devices.

Warning Be sure to enter the correct email if you are adding a mailer. Security Cloud Control does not check email addresses against known users associated with your tenant.

Add an Email Subscription

Before you begin

You must be an **Admin** to view the email subscription list, and a **SuperAdmin** to add, remove, or edit email subscriptions.

Procedure

Step 1 Log into Security Cloud Control.

Step 2 Navigate to **Settings** > **Notification Settings**.

Step 3 In the left pane, click **Administration** > **Notification Settings**.

Step 4 Click the **+** icon in the upper right corner of the page.

Step 5 Enter a valid email address in the text field.

Step 6 Check and uncheck the appropriate checkboxes for events and alerts you want the subscriber to be notified about.

Step 7 Click **Save**. At any point, click **Cancel** to create the new email subscription for the tenant.

Edit Email Subscriptions

Before you begin

You must be an **Admin** to view the email subscription list, and a **SuperAdmin** to add, remove, or edit email subscriptions.

Procedure

Step 1 Log into Security Cloud Control.

Step 2 Navigate to **Settings** > **Notification Settings**.

Step 3 In the left pane, click **Administration** > **Notification Settings**.

Step 4 Locate the email address you want to enable to edit for email subscriptions.

Step 5 Click the **Edit** icon.

Step 6 Edit the following attributes for Security Cloud Control to send alerts to the configured email address:

- **Email address**
- **Device Workflows**
- **Device Events**
- **Event Log Reports**

Step 7 Click **Ok**. At any point, click **Cancel** to negate any changes made to the email subscription.

Delete an Email Subscription

Use the following procedure to delete a mailer from the email subscription list.:

Before you begin

You must be an **Admin** to view the email subscription list, and a **SuperAdmin** to add, remove, or edit email subscriptions.

Procedure

Step 1 Log into Security Cloud Control.

Step 2 Navigate to **Settings** > **Notification Settings**.

Step 3 In the left pane, click **Administration** > **Notification Settings**.

Step 4 Locate the user you want to remove from email subscriptions for the tenant.

Step 5 Click the **Remove** icon for the user you want to remove.

Step 6 Confirm you want to remove the user from the subscription list. Note that this does not affect the user functionality in any way.

Enable Service Integrations for Security Cloud Control Notifications

Enable service integration to forward Security Cloud Control notifications through a specified messaging application or service. You need to generate a webhook URL from your messaging application and point Security Cloud Control to that webhook in Security Cloud Control's **Notification Settings** page to receive notifications.

Security Cloud Control natively supports Cisco Webex, Microsoft Teams, and Slack as service integrations. Messages sent to these services are specially formatted for channels and automated bots.

Note You must check the appropriate boxes for the notifications you want to receive per webhook.

Incoming Webhooks for Webex Teams

Before you begin

Security Cloud Control notifications appear in a designated workspace or as an automated bot in a private message. You must have the following before completing this procedure:

- A Webex account.
- A Security Cloud Control account and tenant.

Use the following procedure to allow incoming webhooks for Webex Teams:

Procedure

Step 1 Open the Webex apphub.

Step 2 Click **Connect** at the top of the page.

Step 3 Scroll to the bottom of the page and configure the following:

- **Webhook name** - Provide a name to identify the messages provided by this application.
- **Select a space** - Use the drop-down menu to choose a Webex **Space**. The Space must already exist in Webex team and you must have access to this space. If a space does not exist, you can create a new space in Webex Teams and refresh the application's configuration page to display the new space.

Note
If a Webex incoming webhook has been configured in the past and you are re-enabling it, the previous webhooks are preserved at the bottom of this page. You can delete previous webhooks if they are no longer needed or if the Webex space no longer exists.

Step 4 Select **Add**. The Webex Space you chose will receive a notification that the application is added.

Step 5 Copy the Webhook URL.

Step 6 Log into Security Cloud Control.

Step 7 From the navigation bar to the left, click **Settings** > **Notification Settings**.

Step 8 In the left pane, click **Administration** > **Notification Settings**.

Step 9 Examine and confirm the notifications that are checked are correct. If they are not, we strongly recommend modifying the notification selection before you connect to a service integration.

Step 10 Scroll to **Service Integrations**.

Step 11 Click the blue plus button.

Step 12 Enter a **Name**. This name appears in Security Cloud Control as a configured service integration. It does not appear in any events forwarded to the configured service.

Step 13 Expand the drop-down menu and select **Webex** as the Service Type.

Step 14 Paste the webhook URL that you generated from the service.

Step 15 Click **OK**.

Incoming Webhooks for Microsoft Teams

Security Cloud Control can forward notifications to Microsoft Teams. These messages are displayed either in a designated channel or as an automated bot in a private chat message in Microsoft Teams. To enable this functionality, you must generate a webhook URL from Microsoft Teams and point Security Cloud Control to that webhook. For more information about adding incoming webhooks to a Microsoft Teams channel, see Create incoming webhooks with Workflows for Microsoft Teams.

Prerequisites

These are the prerequisites to allow Security Cloud Control notifications in Microsoft Teams:

- A Microsoft Teams account.
- A Security Cloud Control account and tenant.

Use this procedure to generate a webhook URL in Microsoft Teams and enable notifications from Security Cloud Control:

Procedure

Step 1 Log in to your Microsoft Teams account.

Step 2 In the **New Teams** client, click **Teams** and navigate to the channel in which you want to add an incoming webhook.

Step 3 Click **More options •••** next to the channel name.

Step 4 Click **Workflows**.

Step 5 Click **Post to a channel when a webhook request is received**.

Step 6 Provide a name for the webhook and click **Next**.

Step 7 Choose the channel where notifications must be posted.

If you use this workflow from a Microsoft Teams chat or channel, these fields get populated automatically.

Step 8 After you enter the required details, click **Add workflow**.

Step 9 Copy the unique webhook URL from the dialog box that is displayed. The URL maps to the channel. You can use it to send information to Teams.

Step 10 Log into Security Cloud Control.

Step 11 From the left pane, click **Settings** > **Notification Settings**.

Step 12 In the left pane, click **Administration** > **Notification Settings**.

Step 13 Scroll to **Service Integrations**.

Step 14 Click the blue plus button.

Step 15 Enter a **Name**.

This name is displayed in Security Cloud Control as a configured service integration. However, it does not appear in any of the events forwarded to the configured service.

Step 16 Expand the drop-down list, and select **Microsoft Teams** as the **Service Type**.

Step 17 Paste the webhook URL generated from Microsoft Teams into **URL**.

Step 18 Under **Send Alerts When**, examine and confirm that the selected notifications are correct. If not, modify the notification selection before proceeding.

Step 19 Click **Save**.

Incoming Webhooks for Slack

Security Cloud Control notifications appear in a designated channel or as an automated bot in a private message. For more information on how Slack handles incoming webhooks, see Slack Apps for more information.

Use the following procedure to allow incoming webhooks for Slack:

Procedure

Step 1 Log into your Slack account.

Step 2 In the panel to the left, scroll to the bottom and select **Add Apps**.

Step 3 Search application directory for **Incoming Webhooks** and locate the app. Select **Add**.

Step 4 If you are not the admin of your Slack workspace, you must send a request to the admin of your org and wait for the app to be added to your account. Select **Request Configuration**. Enter an optional message and select **Submit Request**.

Step 5 Once the Incoming Webhooks app is enabled for your workspace, refresh the Slack settings page and select **Add New Webhook to Workspace**.

Step 6 Use the drop-down menu to select the Slack channel you want the Security Cloud Control notifications to appear in. Select **Authorize**. If you navigate away from this page while waiting for the request to get enabled, simply log into Slack and select the workspace name in the upper left corner. From the drop-down menu, select **Customize Workspace** and select **Configure Apps**. Navigate to **Manage** > **Custom Integrations**. Select **Incoming Webhooks** to open app's landing page and then select **Configuration** from the tabs. This lists all the users within your workspace that has this app enabled. You can only see and edit your account's configuration. Select your workspace name to edit the configuration and move forward.

Step 7 The Slack settings page redirects you to the configuration page for the app. Locate and copy the webhook URL.

Step 8 Log into Security Cloud Control.

Step 9 From the navigation bar to the left, click **Settings** > **Notification Settings**.

Step 10 In the left pane, click **Administration** > **Notification Settings**.

Step 11 Examine and confirm the notifications that are checked are correct. If they are not, we strongly recommend modifying the notification selection before you connect to a service integration.

Step 12 Scroll to **Service Integrations**.

Step 13 Click the blue plus button.

Step 14 Enter a **Name**. This name appears in Security Cloud Control as a configured service integration. It does not appear in any events forwarded to the configured service.

Step 15 Expand the drop-down menu and select **Slack** as the Service Type.

Step 16 Paste the webhook URL that you generated from the service.

Step 17 Click OK.

Incoming Webhooks for a Custom Integration

Before you begin

Security Cloud Control does not format messages for custom integration. If you opt to integrate a custom service or application, Security Cloud Control sends a JSON message.

Refer to the service's documentation on how to enable incoming webhooks and generate a webhook URL. Once you have a webhook URL, use the procedure below to enable webhooks:

Procedure

Step 1 Generate and copy the webhook URL from the custom service or application of your choice.

Step 2 Log into Security Cloud Control.

Step 3 From the navigation bar to the left, click **Settings** > **Notification Settings**.

Step 4 In the left pane, click **Administration** > **Notification Settings**.

Step 5 Examine and confirm the notifications that are checked are correct. If they are not, we strongly recommend modifying the notification selection before you connect to a service integration.

Step 6 Scroll to **Service Integrations**.

Step 7 Click the blue plus button.

Step 8 Enter a **Name**. This name appears in Security Cloud Control as a configured service integration. It does not appear in any events forwarded to the configured service.

Step 9 Expand the drop-down menu and select **Custom** as the Service Type.

Step 10 Paste the webhook URL that you generated from the service.

Step 11 Click OK.

View logging settings

Use **Logging Settings** to check current logging usage for your tenant.

The page shows:

- Your monthly event logging limit.
- The number of days until the limit resets.
- Stored logging usage, which represents the compressed event data that the Cisco cloud received.

Click **View Historical Usage** to review the logs that your tenant received during the last 12 months.

The page also includes links that you can use to request additional storage.

Integrate Your SAML Single Sign-On with Security Cloud Control

Security Cloud Control uses Cisco Secure Sign-On as its SAML single sign-on identity provider (IdP) and Duo Security for multifactor authentication (MFA). This is Security Cloud Control's preferred authentication method.

If, however, customers want to integrate their own SAML single sign-on IdP solution with Security Cloud Control, they can as long as their IdP supports SAML 2.0 and identity provider-initiated workflow.

To integrate your own or third-party identity provider (IdP) with Cisco Security Cloud Sign On, see Cisco Security Cloud Sign On Identity Provider Integration Guide.

If you need more support to integrate your own SAML solution with Security Cloud Control, contact support and create a case.

Attention When you open a case, ensure that you choose **Manually Select A Technology** and select **SecureX - Sign-on and Administration** for your request to reach the right team.

Renew SSO Certificate

Your Identity Provider (IdP) is usually integrated with SecureX SSO. Open a Cisco TAC case and provide the metadata.xml file. For more information, see Cisco SecureX Sign-On Third-Party Identity Provider Integration Guide.

Attention When you open a case, ensure that you choose **Manually Select A Technology** and select **SecureX - Sign-on and Administration** for your request to reach the right team.

(legacy only) If your Identity Provider (IdP) integration is directly with Security Cloud Control, open a support ticket with Security Cloud Control TAC and provide the metadata.xml file.

My Tokens

See API Tokens for more information.

API Tokens

Developers use Security Cloud Control API tokens when making Security Cloud Control REST API calls. The API token must be included in the REST API authorization header for a successful call. Although API tokens serve as "long-lived" access tokens and do not expire, they can be renewed or revoked.

To generate an API token in Security Cloud Control, you must first create an API Only User if one does not already exist. This user is specifically designated for API token generation and usage.

Once the API Only User is created, you can generate a new API token for that user. The token is visible only immediately after it is generated and remains visible as long as you stay on the **General Settings** page. If you navigate away and then return to the **General Settings** page, the token will no longer be displayed, although it is clear that a token has been issued.

Note API Only Users can generate API tokens; individual users cannot create API tokens for themselves or others.

API Token Format and Claims

The API token is a JSON Web Token (JWT). To learn more about the JWT token format, read the Introduction to JSON Web Tokens.

The Security Cloud Control API token provides the following set of claims:

- **id** - user/device uid
- **parentId** - tenant uid

- **ver** - the version of the public key (initial version is 0, for example, **cdo_jwt_sig_pub_key.0**)
- **subscriptions** - Security Services Exchange subscriptions (optional)
- **client_id** - "**api-client**"
- **jti** - token id

Token Management

Create API Only Users

When creating a user, a Super Admin can select "API Only User" to create a virtual user type and generate API token for authenticating to Security Cloud Control when making Security Cloud Control REST API calls. Security Cloud Control prompts you to provide a user name instead of an email address, which ensures that your permissions continue to function even after the original Super Admin departs your organization. The API Only User can't log into the Security Cloud Control interface.

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 From the Security Cloud Control navigation bar, click **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click the **Add a new user** ( ) icon to add a new user to your tenant.

Step 5 Select the **API Only User** checkbox.

Step 6 In the **Username** field, enter a name for the user and click **OK**.

Important
The username can't be an email address or contain the '@' character as the '@yourtenant' suffix will be automatically appended to the username.

Step 7 Select the user's role from the drop-down menu.

Step 8 Click **OK**.

Generate an API Token

To use the Security Cloud Control API, you must have an API token. We recommend creating an API-only user in your Security Cloud Control tenant and generating a token for it.

The token is a long-lived bearer token used in the authorization header of REST API calls. The same token is used for both Security Cloud Control API and the Cloud-Delivered Firewall Management Center API.

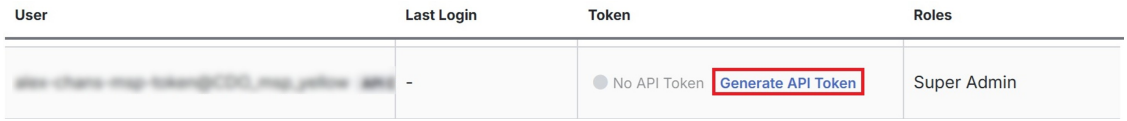

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 From the Security Cloud Control navigation bar, click **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click **Generate API Token** under the **Token** column.

Step 5 Save the token in a secure location that aligns with your enterprise's best practices for handling sensitive data.

What to do next

For more information, see Getting Started with Security Cloud Control Firewall API Documentation.

Refresh an API Token

The API token does not expire. However, you may choose to refresh your API token, which renews the existing token, if the token is lost, compromised, or to conform to your enterprise's security guidelines.

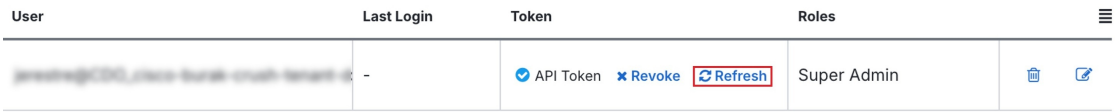

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 From the Security Cloud Control navigation bar, click **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click **Refresh** under the **Token** column. Security Cloud Control generates a new API token.

Step 5 Save the new token in a secure location in accordance with your enterprise's best practices for maintaining sensitive data.

Note
The **Revoke**, **Refresh**, **Delete**, and **Edit** options for the API-only user for the Dynamic Attributes Connector service account (csdac-service@tenantname) have been disabled. This is to ensure users don't delete, edit, or revoke the API tokens for this API account, which is required for the Dynamic Attributes Connector functionality.

Revoke an API Token

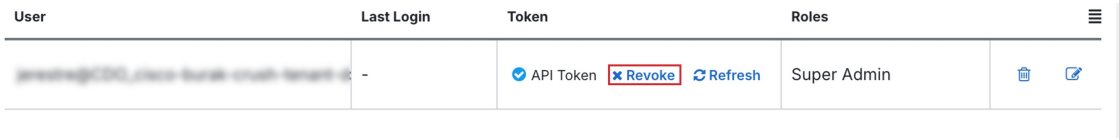

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 From the Security Cloud Control navigation bar, click **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Under the **Token** column, click **Revoke** for the user you want to generate the API token.

Note
The **Revoke**, **Refresh**, **Delete**, and **Edit** options for the API-only user for the Dynamic Attributes Connector service account (csdac-service@tenantname) have been disabled. This is to ensure users don't delete, edit, or revoke the API tokens for this API account, which is required for the Dynamic Attributes Connector functionality.

Relationship Between the Identity Provider Accounts and Security Cloud Control User Records

To log in to Security Cloud Control, a customer needs an account with a SAML 2.0-compliant identity provider (IdP), a multi-factor authentication provider, and a user record in Security Cloud Control. The IdP account contains the user's credentials and the IdP authenticates the user based on those credentials. Multi-factor authentication provides an added layer of identity security. The Security Cloud Control user record primarily contains the username, the Security Cloud Control tenant with which they are associated, and the user's role. When a user logs in, Security Cloud Control tries to map the IdP's user ID to an existing user record on a tenant in Security Cloud Control. When Security Cloud Control finds a match, the user is logged in to that tenant.

Unless your enterprise has its own single sign-on identity provider, your identity provider is Cisco Security Cloud Sign On. Cisco Security Cloud Sign On uses Duo for mutli-factor authentication. Customers can integrate their own IdP with Security Cloud Control if they choose.

Login Workflow

This is a simplified description of how the IdP account interacts with the Security Cloud Control user record to log in a Security Cloud Control user:

Procedure

Step 1 The user requests access to Security Cloud Control by logging in to a SAML 2.0-compliant identity provider (IdP) such as Cisco Security Cloud Sign On (https://sign-on.security.cisco.com) for authentication.

Step 2 The IdP issues a SAML assertion that the user is authentic, and a portal displays the applications the user can access. One of the tiles represents Security Cloud Control.

Step 3 Security Cloud Control validates the SAML assertion, extracts the username and attempts to find a user record among its tenants that corresponding to that username.

- If the user has a user record on a single tenant on Security Cloud Control, Security Cloud Control grants the user access to the tenant and the user's role determines the actions they can take.

- If the user has a user record on more than one tenant, Security Cloud Control presents the authenticated user with a list of tenants they can choose from. The user picks a tenant and is allowed to access the tenant. The user's role on that specific tenant determines the actions they can take.
- If Security Cloud Control does not have a mapping for the authenticated user to a user record on a tenant, Security Cloud Control displays a landing page giving users the opportunity to learn more about Security Cloud Control or request a free trial.

Creating a user record in Security Cloud Control does not create an account in the IdP and creating an account in the IdP does not create a user record in Security Cloud Control.

Similarly, deleting an account on the IdP does not mean you have deleted the user record from Security Cloud Control; although, without the IdP account, there is no way to authenticate a user to Security Cloud Control. Deleting the Security Cloud Control user record does not mean you have deleted the IdP account; although, without the Security Cloud Control user record, there will be no way for an authenticated user to access a Security Cloud Control tenant.

Implications of this Architecture

Customers Who Use Cisco Security Cloud Sign On

For customers who use Security Cloud Control's Cisco Security Cloud Sign On identity provider, a Super Admin can create a user record in Security Cloud Control and a user can self-register themselves with Security Cloud Control. If the two usernames match, and the user is properly authenticated, the user can log in to Security Cloud Control.

Should the Super Admin ever need to prevent a user from accessing Security Cloud Control, they can simply delete the Security Cloud Control user's user record. The Cisco Security Cloud Sign On account will still exist and if the Super Admin ever wants to restore the user, they can by creating a new Security Cloud Control user record with the same username as the one used for Cisco Security Cloud Sign On.

Should a customer ever run into a problem with Security Cloud Control that requires a call to our Technical Assistance Center (TAC), the customer could create a user record for the TAC engineer so they could investigate the tenant and report back to the customer with information and suggestions.

Customers Who Have Their Own Identity Provider

For customers who have their own identity provider, they control both the identity provider accounts and the Security Cloud Control tenants. These customers can create and manage identity provider accounts and user records in Security Cloud Control.

Should they ever need to prevent a user from accessing Security Cloud Control, they can delete the IdP account, the Security Cloud Control user record, or both.

If they ever need help from Cisco TAC, they can create both the identity provider account and a Security Cloud Control user record, with a read-only role, for their TAC engineer. The TAC engineer would then be able to access the customer's Security Cloud Control tenant, investigate, and report back the customer with information and suggestions.

Cisco Managed Service Providers

If Cisco Managed Service Providers (MSPs) use Security Cloud Control's Cisco Security Cloud Sign On IdP, they can self-register for Cisco Security Cloud Sign On and their customers can create a user record for them

in Security Cloud Control so that the MSP can manage the customer's tenant. Of course, the customer has full control to delete the MSP's record when they choose to.

The Cisco Success Network

Cisco Success Network is a user-enabled cloud service. When you enable Cisco Success Network, a secure connection is established between the device and the Cisco cloud to stream usage information and statistics. Streaming telemetry provides a mechanism to select data of interest from the device and to transmit it in a structured format to remote management stations for the following benefits:

- To inform you of available unused features that can improve the effectiveness of the product in your network.
- To inform you of additional technical support services and monitoring that might be available for your product.
- To help Cisco improve our products.

The device establishes and maintains the secure connection at all times, and allows you to enroll in the Cisco Success Network. After you have registered the device, you can change the Cisco Success Network setting.

Note

- For Firewall Threat Defense high availability pairs, the selection of the active device overrides the Cisco Success Network setting on the standby device.
- Security Cloud Control does not manage the Cisco Success Network settings. The settings managed through, and telemetry information is provided by, the Firewall Device Manager user interface.

Enable or Disable the Cisco Success Network

During initial system setup, you are prompted to register the device with Cisco Smart Software Manager. If you instead elected to use the 90-day evaluation license, you must register the device before the end of the evaluation period. To enroll the device, either register the device with Cisco Smart Software Manager (on the Smart Licensing page) or enroll with Security Cloud Control by entering a registration key.

When you register the device, your virtual account allocates the license to the device. Registering the device also registers any optional licenses that you have enabled.

You can turn off this connection at any time by disabling Cisco Success Network, although you can only disable this option through the Firewall Device Manager UI. Disabling will disconnect the device from the cloud. Disconnection does not impact the receipt of updates or the operation of the Smart Licensing capabilities, which continue to operate normally. See the **Connecting to the Cisco Success Network** section of the System Administration chapter of the Firepower Device Manager configuration Guide, Version 6.4.0 or later for more information.

Manage Users in Security Cloud Control

Before you create or edit a user record in Security Cloud Control, read Relationship Between Identity Provider Accounts and Security Cloud Control User Records to learn how the identity provider (IdP) account and the user record interact. Security Cloud Control users need a record and a corresponding IdP account so they can be authenticated and access the Security Cloud Control tenant.

Unless your enterprise has its own IdP, Cisco Secure Sign-On is the identity provider for all Security Cloud Control tenants. The rest of this article assumes you are using Cisco Secure Sign-On as your identity provider.

You can see all the user records associated with your tenant on the **User Management** screen. This includes any Cisco support engineer who is temporarily associated with your account to resolve a support ticket.

Manage Super Admins on Your Tenant

View the API User Records Associated with your Tenant

Procedure

Step 1 In the left pane, choose **Settings** > **User Management**.

Step 2 In the left pane, **Administration** > **API User Management**.

Active Directory Groups in User Management

For tenants that have a high turnover for large quantities of users, you can map Security Cloud Control to your Active Directory (AD) groups instead of adding individual users to Security Cloud Control for an easier way to manage your user lists and user roles. Any user changes, such as a new user addition or removing existing users, can now be done in Active Directory and no longer need to be done in Security Cloud Control.

You must have a **SuperAdmin** user role to add, edit, or delete an Active Directory group from the **User Management** page. See User Roles for more information.

In the left pane, choose **Settings** > **User Management**

Active Directory Groups

- In the left pane, choose **Settings** > **User Management** > **Active Directory Groups**. This page shows the Active Directory groups that are currently mapped to Security Cloud Control.
- In the left pane, click **Administration** > **API User Management > Active Directory Groups**.
- This page displays the role of the Active Directory group as assigned in your Active Directory manager.
- Users within an Active Directory group are not listed individually in either the **Active Directory Groups** tab or the **Users** tab.

Audit Logs

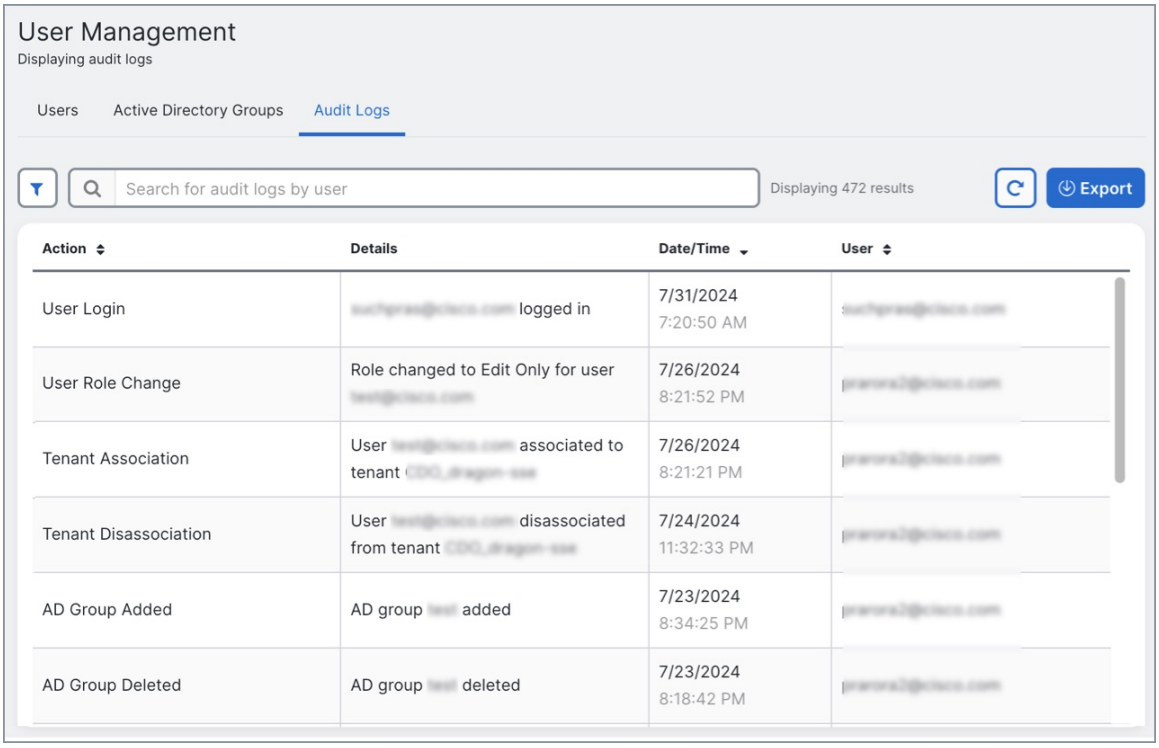

Audit Logs in Security Cloud Control record user-related and system-level actions. Key events that are captured by the **Audit Logs** include:

- **User Login:** Records every instance of user authentication.
- **Tenant Association and Disassociation:** Tracks user associations with, or disassociations from, tenants.
- **User Role Change:** Records any modifications to user roles.
- **Active Directory Groups:** Records any addition, deletion, and role changes within AD groups.

Procedure:

1. In the left pane, click **Settings** > **User Management**.
2. In the left pane, click **Administration** > **API User Management**.
3. Click the **Audit Logs** tab. A list of events and activities in the current tenant you are logged into is displayed.
4. Use the **Search** text box to find logs for a specific user.
5. Click the filter icon to refine your search results and view specific events. You can filter the logs based on the **Time Range** and **Event Action**.
6. Click **Export** to download the details in CSV format.

Figure 1: Audit Logs

Multi-role Users

As an extension along the IAM capabilities in Security Cloud Control, it is now possible for a user to have multiple roles.

A user can be part of multiple groups in Active Directory, and those groups can be defined in Security Cloud Control with different Security Cloud Control roles. The final permissions that a user gets on login are a combination of the roles of all the Active Directory groups that are defined in Security Cloud Control that the user is part of. For instance, if a user is part of two Active Directory groups and both the groups are added in Security Cloud Control with two different roles such as edit-only and deploy-only, the user would have both edit-only and deploy-only permissions. This applies to any number of groups and roles.

Active Directory group mappings must only be defined one time in Security Cloud Control, and managing access and permissions for users can after be achieved exclusively in Active Directory by adding, removing, or moving users between different groups.

Note If a user is both an individual user and part of an Active Directory group on the same tenant, the user role of the individual user overrides the user role of the Active Directory group.

API Endpoints for Active Directory Groups

If you are a super admin, you can use API endpoints to do the following:

- Create an Active Directory group
- Remove an Active Directory group
- Modify an Active Directory group
- Get Active Directory groups
- Get an Active Directory group

The aforementioned links point to the corresponding sections of the Cisco DevNet website.

Prerequisites for Adding an Active Directory Group to Security Cloud Control

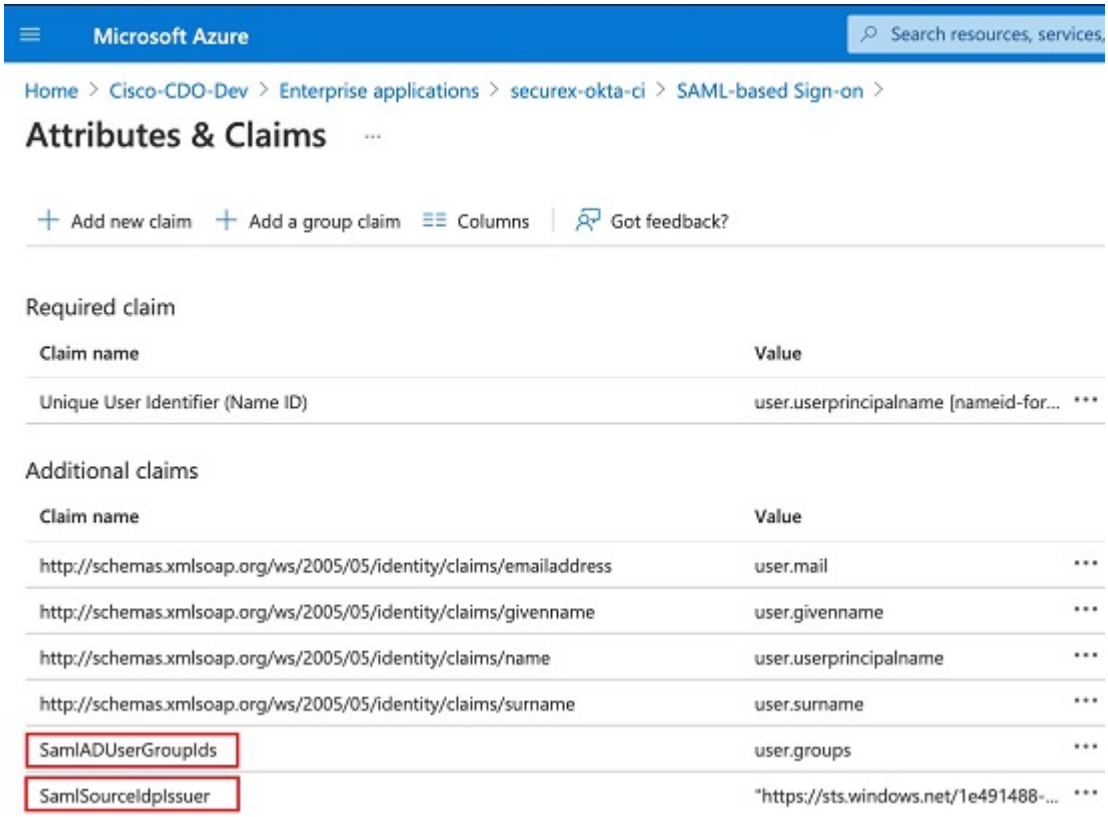

Before adding an Active Directory group mapping to Security Cloud Control as a form of user management, you must have your Active Directory that is integrated with Security Cloud Sign On. If your Active Directory Identity Provider (IdP) is not already integrated, see identity provider integration guide to integrate a custom Active Directory IdP integration with the following information:

- Your Security Cloud Control tenant name and region
- Domain to define custom routing for (for example: @cisco.com, @myenterprise.com)
- Certificate and federation metadata in the XML format

After your Active Directory integration is complete, add the following custom SAML claims in your Active Directory. The SAML claims and attributes are required, for you to be able to successfully sign-in to your Security Cloud Control tenant after your Active Directory integration is done. These values are case sensitive:

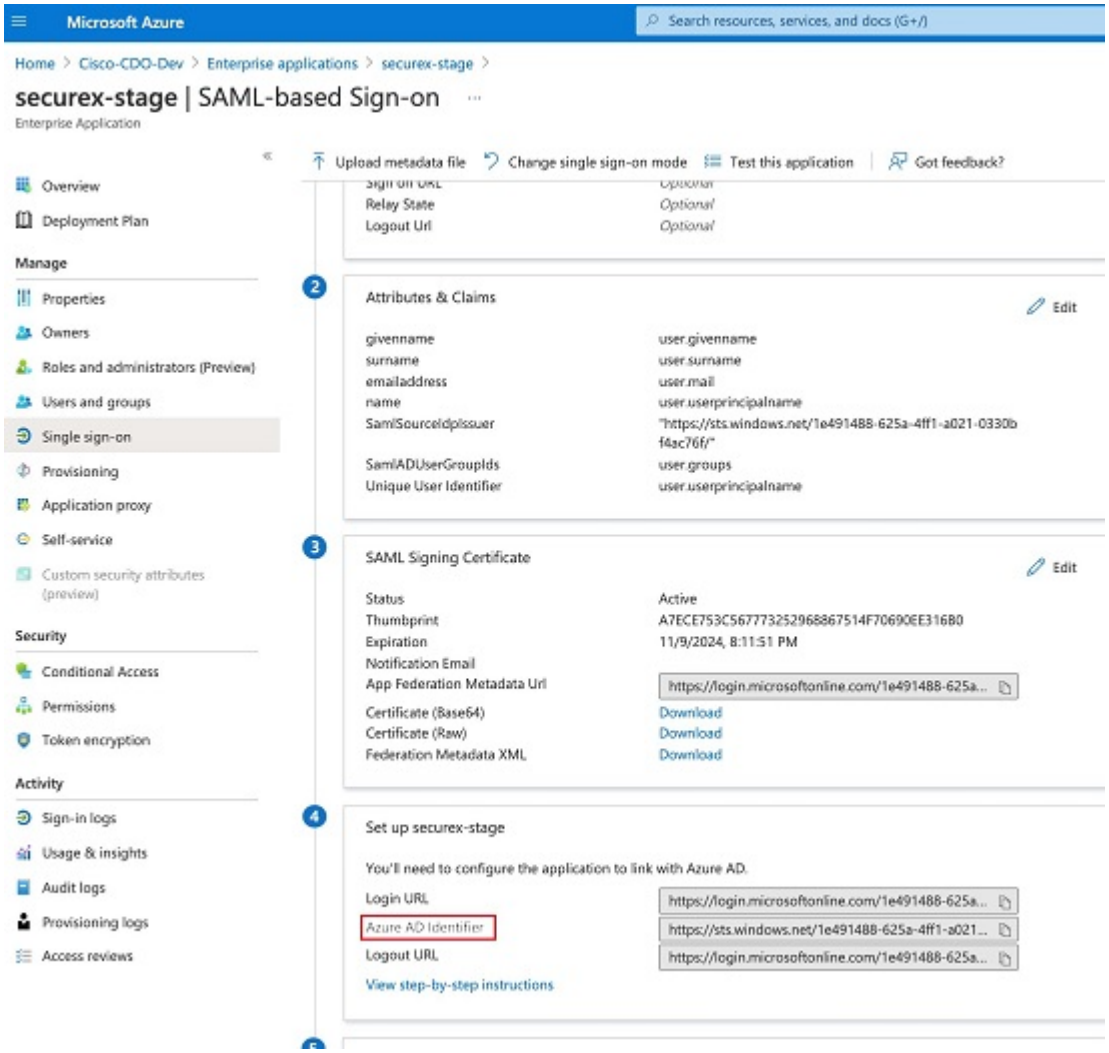

- **SamlADUserGroupIds -** This attribute describes all group associations that a user has on Active Directory. For example, in Azure select **+ Add a group claim** as seen in the screenshot below:

Figure 2: Custom Claims Defined in Active Directory

- **SamlSourceIdpIssuer** - This attribute uniquely identifies an Active Directory instance. For example, in Azure select **+ Add a group claim** and scroll to locate the Azure Active Directory Identifier as seen in the screenshot below:

Figure 3: Locate the Azure Active Directory Identifier

Add an Active Directory Group for User Management

You must have a **SuperAdmin** user role to add, edit, or delete an Active Directory group.

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 In the left pane, choose **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click the **Active Directory Groups** tab.

Step 5 Click the add Active Directory group (+) button.

Step 6 Provide the following information:

- **Group Name**: Enter a unique name. This name does not have to match the group name in your Active Directory. Security Cloud Control does not support special characters for this field.
- **Group Identifier**: Manually enter the Group Identifier from your Active Directory. The value of the group identifier should be the same as the group identifier in the custom claim definition. It could be any value that corresponds to the unique identity of the group, for example, my-favourite-group, 12345, and so forth.
- **AD Issuer**: Manually enter the Active Directory Issuer value from your Active Directory.
- **Role**: Select a user role. This determines the role for all the users included in this Active Directory group. See User Roles for more information.
- (Optional) **Notes**: Add any notes that are applicable to this Active Directory group.

Step 7 Select **OK**.

Edit an Active Directory Group for User Management

Before you begin

Note that editing an Active Directory Group's user management in Security Cloud Control only allows you to modify how Security Cloud Control limits the Active Directory group. You cannot edit the Active Directory group itself in Security Cloud Control. You must use Active Directory to edit the list of users within an Active Directory group.

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 In the left pane, choose **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click the **Active Directory Groups** tab.

Step 5 Identify the Active Directory Group you want to edit and click the edit icon.

Step 6 Modify the following values:

- **Group Name**: Enter a unique name. Security Cloud Control does not support special characters for this field.
- **Group Identifier**: Manually enter the Group Identifier from your Active Directory. The value of the group identifier should be the same as the group identifier in the custom claim definition. It could be any value that corresponds to the unique identity of the group, for example, my-favourite-group, 12345 and so forth.
- **AD Issuer**: Manually enter the Active Directory Issuer value from your Active Directory.
- **Role**: This determines the role for all the users included in this Active Directory group. See User Roles for more information.

- **Notes**: Add any notes that are applicable to this Active Directory group.

Step 7 Click **OK**.

Delete an Active Directory Group for User Management

Procedure

Step 1 Log in to Security Cloud Control.
Step 2 In the left pane, choose **Settings** > **User Management**.
Step 3 In the left pane, click **Administration** > **API User Management**.
Step 4 Click the **Active Directory Groups** tab.
Step 5 Identify the Active Directory Group you want to delete.
Step 6 Click the delete icon.
Step 7 Click **OK** to confirm you want to delete the Active Directory group.

Create a New Security Cloud Control User

These two tasks are necessary for creating a new Security Cloud Control user. They do not have to be done in sequence:

- Create a Cisco Secure Sign-on Account for the New User
- Create a Security Cloud Control User Record with Your Security Cloud Control Username

After these tasks are done, then the user can open Security Cloud Control from the Cisco Secure Sign-On dashboard.

Create a Cisco Security Cloud Sign On Account for the New User

Creating a Cisco Security Cloud Sign On account can be done by the new user at any time, without needing to know the name of the assigned tenant.

About Logging in to Security Cloud Control

Security Cloud Control uses Cisco Secure Sign-On as its identity provider and Duo for multi-factor authentication (MFA). **To log into Security Cloud Control, you must first create your account in Cisco Security Cloud Sign On and configure MFA using Duo**.

Security Cloud Control requires MFA which provides an added layer of security in protecting your user identity. Two-factor authentication, a type of MFA, requires two components, or factors, to ensure the identity of the user logging into Security Cloud Control. The first factor is a username and password, and the second is a one-time password (OTP), which is generated on demand.

Important **If your Security Cloud Control tenant existed before October 14, 2019**, use Migrate to Cisco Security Cloud Sign On Identity Provider for log in instructions instead of this article.

Before You Log In

Install DUO Security

We recommend installing the Duo Security app in a mobile phone. Review Duo Guide to Two Factor Authentication: Enrollment Guide if you have questions about installing Duo.

Time Synchronization

You are going to use your mobile device to generate a one-time password. It is important that your device clock is synchronized with real time as the OTP is time-based. Make sure your device clock set automatically or manually set it to the correct time.

Create a New Cisco Security Cloud Sign On Account and Configure Duo Multi-factor Authentication

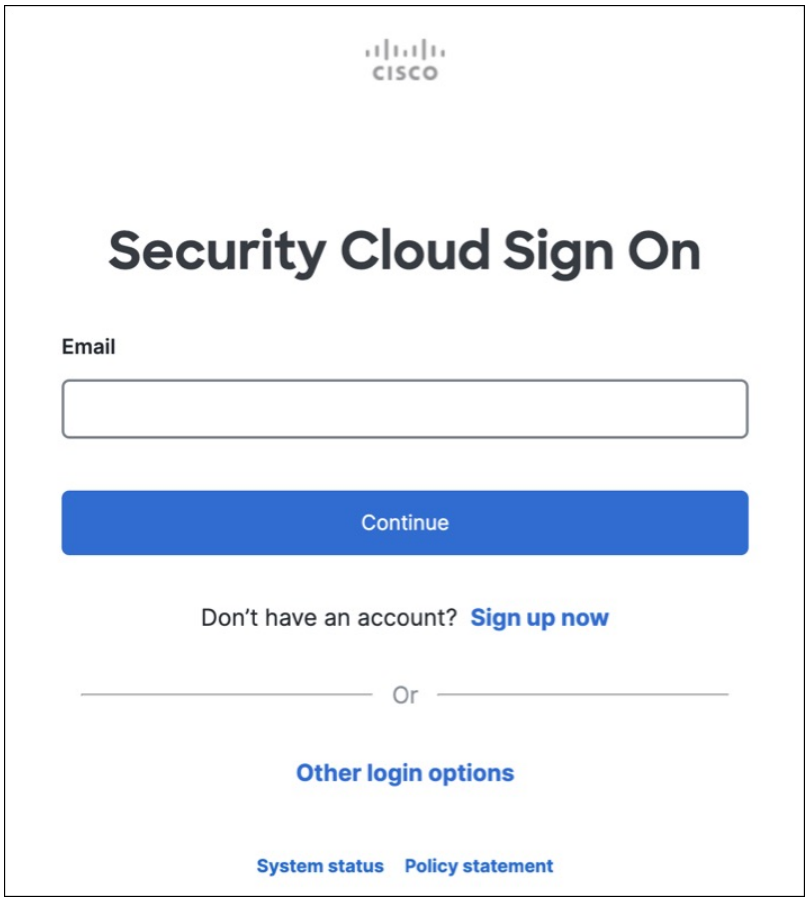

The initial sign-on workflow is a four-step process. You need to complete all four steps.

Procedure

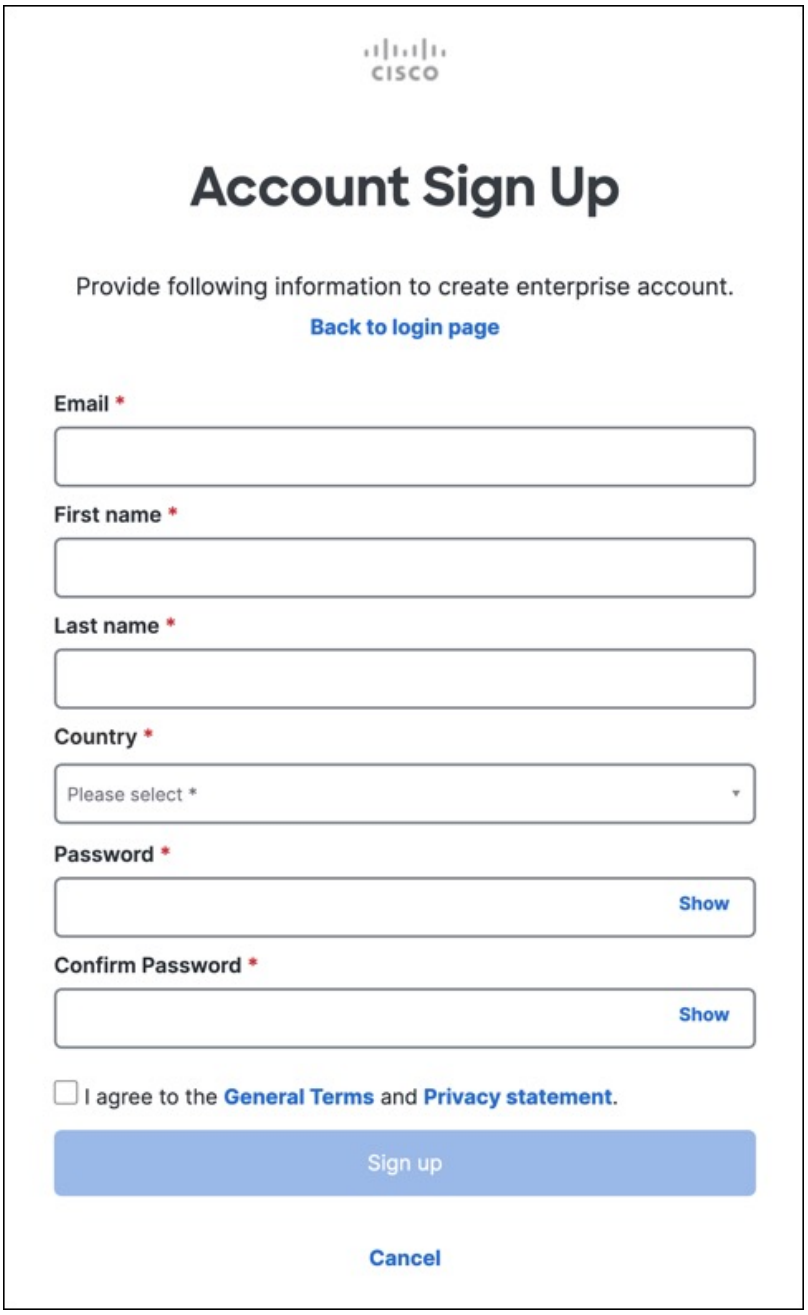

Step 1 **Sign Up for a New Cisco Security Cloud Sign On Account**.

a. Open https://sign-on.security.cisco.com.

b. At the bottom of the sign in screen, click **Sign up now**.

c. Provide the following information to create enterprise account.

Here are some tips:

- **Email**: Enter the email address that you will eventually use to log in to Security Cloud Control.
- **Password**: Enter a strong password.

d. Click **Sign up**.

Cisco sends you a verification email to the address you registered with. Open the email and click **Activate account**.

Step 2 **Set up Multi-factor Authentication Using Duo**

We recommend using a mobile device when setting up multi-factor authentication.

a. In the **Set up multi-factor authentication** screen, click **Configure factor**.

b. Click **Start setup** and follow the prompts to choose a mobile device and verify the pairing of that mobile device with your account.

For more information, see Duo Guide to Two Factor Authentication: Enrollment Guide. If you already have the Duo app on your device, you'll receive an activation code for this account. Duo supports multiple accounts on one device.

c. At the end of the wizard click **Continue to Login**.

d. Log in to Cisco Security Cloud Sign On with the two-factor authentication.

Step 3 **(Optional) Setup Google Authenticator as an additional authenticator**

a. Choose the mobile device you are pairing with Google Authenticator and click **Next**.

b. Follow the prompts in the setup wizard to setup Google Authenticator.

Step 4 **Configure Account Recovery Options for your Cisco Security Cloud Sign On**

a. Choose a recovery phone number for resetting your account using SMS.

b. Choose a security image.

c. Click **Create My Account**.

Create a User Record with Your Security Cloud Control Username

Only a Security Cloud Control user with **Super Admin** privileges can create the Security Cloud Control user record. The **Super Admin** must create the user record with the same email address that was specified in the **Create Your Security Cloud Control Username** task above.

Use the following procedure to create a user record with an appropriate user role:

Procedure

Step 1 Login to Security Cloud Control.

Step 2 In the left pane, choose **Settings** > **User Management**.

Step 3 Click  to add a new user to your tenant.

Step 4 Provide the email address of the user.

Note
The user's email address must correspond to the email address of the Cisco Secure Log-On account.

Step 5 From the **Role** drop-down list, select the user's role.

Step 6 Click **OK**.

The New User Opens Security Cloud Control from the Cisco Secure Sign-On Dashboard

Procedure

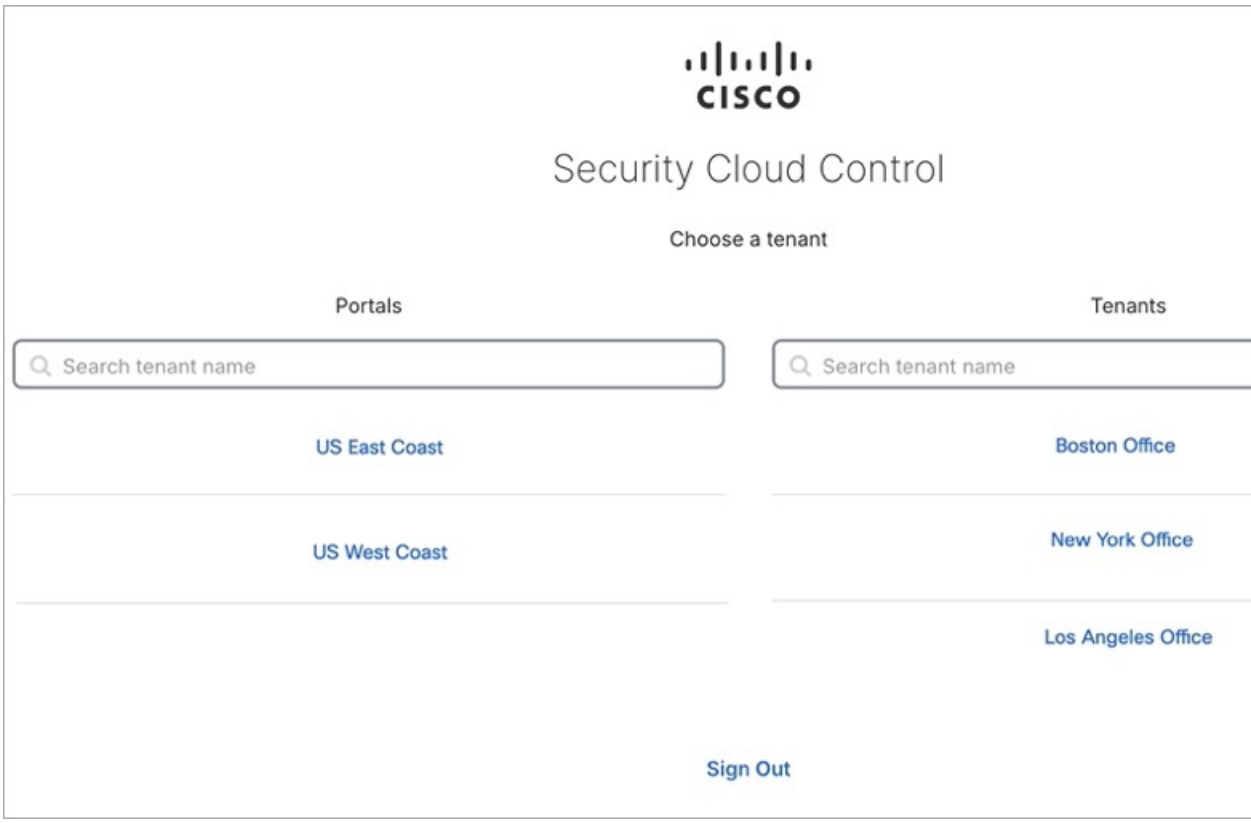

Step 1 Click the appropriate **Security Cloud Control** tile on the Cisco Secure Sign-on dashboard for your tenant's region.

Step 2 Click the authenticator logo to choose Duo Security or Google Authenticator if you have set up both authenticators.

- If you already have a user record on an existing tenant, you are logged into that tenant.
- If you already have a user record on several portals, you will be able to choose which portal to connect to.
- If you already have a user record on several tenants, you will be able to choose which Security Cloud Control tenant to connect to.
- If you do not already have a user record on an existing tenant, you will be able to learn more about Security Cloud Control or request a trial tenant.

The **Portals** view retrieves and displays consolidated information from multiple tenants.

The **Tenant** view shows several tenants on which you have a user record.

Understand user roles in Security Cloud Control Firewall Management

Security Cloud Control Firewall Management assigns roles per user and per organization. If a user has access to more than one tenant, that user can have the same user ID but different roles on different organizations. For example, a user can have the `Read-Only` role on one organization and the `Super Admin` role on another.

When the interface or documentation refers to a `Read-Only` user, `Admin` user, or `Super Admin` user, it describes that user's permission level on a specific organization.

Read-only role

A user assigned the Read-Only role sees this blue banner on every page:

Read Only User. You cannot make configuration changes.

Users with the `Read-Only` role can:

- View any page or any setting in Security Cloud Control.

- View all device configuration details including sensitive values in device configurations, such as certificates, PSKs, and credentials.

Note Note: For ASA devices, we recommend enabling password encryption as a best practice. Password encryption helps prevent PSKs and credentials from being visible in clear text in the configuration.

- Compare device configurations, view the change log, and see VPN mappings.
- Search and filter the contents of any page.
- View every warning regarding any setting or object on any page.
- Generate, refresh, and revoke their own API tokens. Note that if a read-only user revokes their own token, they cannot recreate it.
- Contact support through our interface and can export a change log.

Users with the `Read-Only` role cannot:

- Create, update, configure, or delete anything on any page.
- Onboard devices.
- Step-through the tasks needed to create something like an object or a policy, but not be able to save it.
- Create Security Cloud Control user records.
- Change user role.
- Attach or detach access rules to a policy.

Edit-Only role

Users with the Edit-Only role can:

- Edit and save device configurations, including but not limited to objects, policies, rulesets, interfaces, VPN, etc.
- Allow configuration changes that are made through the **Read Configuration** action.
- Utilize the Change Request Management action.

Users with the Edit-Only role cannot:

- Deploy changes to a device or to multiple devices.
- Discard staged changes or changes that are detected through OOB.
- Upload AnyConnect Packages, or configure these settings.
- Schedule or manually start image upgrades for devices.
- Schedule or manually start a security database upgrade.

- Manually switch between Snort 2 and Snort 3 versions.
- Create a template.
- Change the existing OOB Change settings.
- Edit System Management settings.
- Onboard devices.
- Delete devices.
- Delete VPN sessions or user sessions.
- Create Security Cloud Control user records.
- Change user role.

Deploy-Only role

Users with the Deploy-Only role can:

- Deploy staged changes to a device, or to multiple devices.
- Revert or restore configuration changes for ASA devices.
- Schedule or manually start image upgrades for devices.
- Schedule or manually start a security database upgrade.
- Utilize the Change Request Management action.

Users with the `Deploy-Only` role cannot:

- Manually switch between Snort 2 and Snort 3 versions.
- Create a template.
- Change the existing OOB Change settings.
- Edit System Management settings.
- Onboard devices.
- Delete devices.
- Delete VPN sessions or user sessions.
- Create, update, configure, or delete anything on any page.
- Onboard devices.
- Step-through the tasks needed to create something like an object or a policy, but not be able to save it.
- Create Security Cloud Control user records.
- Change user role.
- Attach or detach access rules to a policy.

VPN Sessions Manager role

The `VPN Sessions Manager` role is intended for administrators who monitor remote access VPN connections, not site-to-site VPN connections.

Users with the VPN Sessions Manager role can:

- View any page or any setting in Security Cloud Control.
- Search and filter the contents of any page.
- Compare device configurations, view the change log, and see RA VPN mappings.
- View every warning regarding any setting or object on any page.
- Generate, refresh, and revoke their own API tokens. Note that if a VPN Sessions Manager user revokes their own token, they cannot recreate it.
- Contact support through our interface and export a change log.
- Terminate existing RA VPN sessions.

Users with the VPN Sessions Manager role cannot:

- Create, update, configure, or delete anything on any page.
- Onboard devices.
- Step-through the tasks needed to create something like an object or a policy, but not be able to save it.
- Create Security Cloud Control user records.
- Change user role.
- Attach or detach access rules to a policy.

Admin role

Users with the `Admin` role have complete access to most areas of Security Cloud Control Firewall Management.

- Create, read, update, and delete any object or policy in Security Cloud Control Firewall Management and configure any setting.
- Onboard devices.
- View any page or any setting in Security Cloud Control.
- Search and filter the contents of any page.
- Compare device configurations, view the change log, and see VPN mappings.
- View every warning regarding any setting or object on any page.
- Generate, refresh, and revoke their own API tokens. If their token is revoked, they can contact support through our interface and can export a change log.

Admin users **cannot** do the following:

- Create Security Cloud Control user records.
- Change user role.

Super Admin role

Users with the Super Admin role have complete access to all areas of Security Cloud Control Firewall Management.

Users with the Super Admin role can:

- Change user roles.
- Create user records.
- Create, read, update, and delete any object or policy in Security Cloud Control Firewall Management and configure any setting.
- Onboard devices.
- View any page or any setting in Security Cloud Control Firewall Management.
- Search and filter the contents of any page.
- Compare device configurations, view the change log, and see VPN mappings.
- View every warning regarding any setting or object on any page.
- Generate, refresh, and revoke their own API tokens. If their token is revoked, they can
- Contact support through our interface and can export a change log.

Change The Record of the User Role

The user record is the currently recorded role of a user. By looking at the users associated with your tenant, you can determine what role each use has by their record. By changing a user role, you change the user record. User's roles are identified by their role in the User Management table. See User Management for more information.

You must be a Super Admin to change the user record. If your tenant has no Super Admins, contact Security Cloud Control support.

Add a User Account to Security Cloud Control

Security Cloud Control users need a Security Cloud Control record and a corresponding IdP account so they can be authenticated and access your Security Cloud Control tenant. This procedure creates the user's Security Cloud Control user record, not the user's account in Cisco Security Cloud Sign On. If the user does not have an account in Cisco Security Cloud Sign On, they can self-enroll by navigating to https://sign-on.security.cisco.com and clicking **Sign up** at the bottom of the Sign in screen.

Note You will need to have the role of Super Admin on Security Cloud Control to perform this task.

Create a User Record

Use the following procedure to create a user record with an appropriate user role:

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 From the Security Cloud Control navigation bar, click **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click the blue plus button ( ) to add a new user to your tenant.

Step 5 Provide the email address of the user.

Note
The user's email address must correspond to the email address of the Cisco Secure Log-On account.

Step 6 Select the user's role from the drop-down menu.

Step 7 Click **Save**.

Note
Though Super Admins can create a Security Cloud Control user record, that user record is not all that is needed for a user to log in to your tenant. The user also needs an account with the identity provider used by your tenant. Unless your enterprise has its own single sign-on identity provider, your identity provider is Cisco Secure Sign-on. Users can self-register for their Cisco Secure Sign-On account; see Initial Login to Your New Security Cloud Control Tenant for more information.

Edit a User Record for a User Role

You will need to have the role of Super Admin to perform this task. If the Super Admin changes the role of a Security Cloud Control user that is logged in, once their role has been changed, the user is automatically logged out of their session. Once the user logs back in, they assume their new role.

Note You will need to have the role of Super Admin on Security Cloud Control to perform this task.

Caution Changing the role of a user record will delete an API token associated with the user record if there is one. The user must generate a new API token once the user role changes.

Edit a User Role

Note If a Security Cloud Control user is logged in, and a Super Admin changes their role, the user must log out and log back in again for the change to take effect.

To edit the role defined in the user record, follow this procedure:

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 From the Security Cloud Control navigation bar, click **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click the edit icon in the user's row.

Step 5 Select the user's new role from the Role drop-down menu.

Step 6 If the user record shows that there is an API token associated with the user, you will need to confirm that you want to change the user's role and delete the API token as a result.

Step 7 Click **v**.

Step 8 If Security Cloud Control deleted the API token, contact the user so that they may create a new API Token.

Note
The **Revoke**, **Refresh**, **Delete**, and **Edit** options for the API-only user for the Dynamic Attributes Connector service account (csdac-service@tenantname) have been disabled. This is to ensure customers don't delete, edit, or revoke the API tokens for this API account, which is required for the Dynamic Attributes Connector functionality.

Delete a User Record for a User Role

Deleting a user record in Security Cloud Control prevents the associated user from logging in to Security Cloud Control by breaking the mapping of the user record with the Cisco Security Cloud Sign On account. When you delete a user record, you are also deleting the API token associated with that user record should there be one. Deleting a user record in Security Cloud Control does not delete the user's IdP account in Cisco Security Cloud Sign On.

Note You will need to have the role of Super Admin on Security Cloud Control to perform this task.

Delete a User Record

To delete the role defined in the user record, see the following procedure:

Procedure

Step 1 Log in to Security Cloud Control.

Step 2 From the Security Cloud Control navigation bar, click **Settings** > **User Management**.

Step 3 In the left pane, click **Administration** > **API User Management**.

Step 4 Click the trash can icon in the row of the user you want to delete.

Step 5 Click **OK**.

Step 6 Confirm that you want to remove the account from the tenant by clicking OK.

Note
The **Revoke**, **Refresh**, **Delete**, and **Edit** options for the API-only user for the Dynamic Attributes Connector service account (csdac-service@tenantname) have been disabled. This is to ensure customers don't delete, edit, or revoke the API tokens for this API account, which is required for the Dynamic Attributes Connector functionality.
